I'm trying to build a web app using Ruby on Rails where a user can login through Facebook or Google Plus and then I will store their details in the session/database (just wondering if that's the best way to do it). Also, if I want to track the user across multiple pages within my web app (they will be using my app for about 20 pages) should I use the session or save the details in the database? If I use session, will that be stored server-side or will it be stored on the users browser?

A: There are two kinds of data you will use: User specific data (for example username) User information about the session The first case you will keep in a database, the second case in a session. The second case consists of a hash like: `UserInfo= { facebook_id => "1", google_plus_id => "2" }` Then your controller will load the data from the hash if the user is logged in with the mentioned ID, or load the info from the database if not. Now, with this info you can get the user name from the hash (assuming that this method is called when the page is loaded, to check if the user is logged in), and if it is the case you'll use the hash data to save it in the session. In this tutorial, I will show you how you can create a live site, for free, using a free hosting service, and without even registering. Yes, you read that correctly. This is not a paid tutorial, and I will not be asking for your credit card information. This tutorial has been created using the free online service called Tuts+ Web Hosting, which is offered by the folks at Tuts+. They have a very clean and easy to use interface, where you can get a basic site up and running, for free, without having to login to your account. Just click the "Create Free Site" button on the left, and choose the "Basic
