Universal Java-based package that lets you easily interact with your databases Functionalities include managing connections, tables and records, building SQL queries, sorting and filtering data, export data to CSV or PDF, and much more Tutorials To interact with a database, you first need to connect to it. To do so, you must provide the host, username, password, and database name, among other parameters. The rest is easy. Just click on the connection manager and select a database, and you are on your way to exploring the contents. You can perform the following actions: Explore the tables. Select a table to view its contents. Click on one of the displayed tables to bring up its schema. Select a column to view its properties. Set the order in which you want your records to be displayed. This can be done via drag-and-drop. Sort the records by the specified column. Select a record to modify it. Write SQL queries and execute them. The visual query builder. Export database content to CSV or PDF. Search by pattern. Retrieve statistical information. Extend MyJSQLView with a plugin to access additional databases. Get more out of it with plugins. Documentation Get quick access to the MyJSQLView online user manual and related tutorials. By Frank Acedo Last updated on May 23, 2016 1 Comment Most of us have access to a number of databases, and we use them for a variety of purposes. For instance, to keep track of what we eat, what we buy, or what we like to eat. There is an old saying about each of us having a unique culinary fingerprint. We also maintain a home inventory, we keep track of all the things we have, and we keep track of what we want to keep. Every single of these is a database. We can also gather an entire portfolio of data, and we use databases to manage them all. Interacting with databases Interacting with databases is no easy task and experience is required to manage entries and connections or running queries. Aiming to provide an easier way to explore the contents of a database and modify entries, MyJSQLView deploys a Java-based package that serves both experts and novices who are still learning about database management. Connect to your database to see and edit records The array of supported databases is not disappointing at all, as it comprises some of the most used servers, namely MySQL, Microsoft SQL Server, HSQL, H2, PostgreSQL, Derby, Access, MariaDB, Oracle, and SQLite. The login manager enables you to configure new connections to your databases. Some require your computer to be equipped with special JDBC drivers that allow MyJSQLView to read the content of the
