Comparative study of the changes in the level of the resistance of the cervical part of the vagina following surgical treatment of the cervix with radical surgery and radical surgery with concomitant external beam radiotherapy. Comparative study of the changes in the resistance of the cervical part of the vagina following surgical treatment of the cervix with radical surgery and radical surgery with concomitant external beam radiotherapy. Surgery of the cervix in more than 1200 patients in the Surgical Clinic of the Medical University of Wroclaw from 2000 to 2006. The material for study was 250 patients treated surgically between 2000-2006. These patients were divided into two groups: group 1 - patients, who underwent surgical treatment of the cervix without radiotherapy and group 2 - patients who underwent surgical treatment of the cervix with concomitant external beam radiotherapy. We measured resistance of the cervical part of the vagina by means of a "Usho" device (Möller-Maier Möller, Karlsruhe, Germany). The resistance of the cervical part of the vagina was measured prior to surgery, and subsequently in the sixth and 12th month after treatment. The study took into consideration the following subgroups: subgroup 1 - patients with resistance to the vaginal orifice (n = 16), subgroup 2 - patients with resistance to the proximal part of the vagina (n = 61), subgroup 3 - patients with resistance to the distal part of the vagina (n = 119), subgroup 4 - patients with resistance to the vaginal wall (n = 137), subgroup 5 - patients with resistance to the vaginal lumen (n = 18). A statistically significant decrease in resistance to the vaginal orifice was found in the group of patients treated with radical surgery in comparison to the controls, in both the sixth and the 12th month following the operation. A statistically significant decrease in resistance to the proximal part of the vagina was found in patients treated surgically in the 12th month of the post-treatment period in comparison to the controls, both in the sixth and 12th month following surgery
