Ethernet Bridge Configuration Tool Full Crack Main Functionality: The application is designed to create a bridge interface between two network adapters (either wireless network adapter and modem or between your PC and router or between PCs). Interface (BRIDGE) can be created with a specific MAC address (static MAC) or with an IP address (dynamic IP). It is possible to assign a specific IP address or subnet mask to create a static IP pool. If you don't do this, the default IP address pool of the adapter will be used. Generate NetBIOS name for the bridge interface. The applications allows to manage your IP pool, Gateway, etc. The IP pool will be used as IP address pool for the created interface. You can define VLAN ID for the interface. You have to map VLAN ID of adapter to VLAN ID of the bridge interface. If you are using dynamic IP address for the interface you can create MAC address filter for the bridge interface and define IP address(s) for the VLAN IDs that will be mapped to the interface. Generate NetBIOS name for the created bridge interface. The application can be used for debugging, it will show all the packets that are passed on the interface. The application allows to to map network interface for the IP address pool that you configured. With this function you will be able to access your network interface from another PC on the same IP address pool. The application allows to configure the bridge interface for VLAN ID if you are using them. You will be able to configure your routers for bridging multiple VLANs. In this function you will be able to do the reverse operation and map VLAN ID of the interface to VLAN ID of the interface. When you run the application, the current settings will be presented to the user. If the user changes something, the application will apply the changes immediately and ask user for confirmation. This is a small but versatile application. It is mainly targeted at laptop users who want to have Wi-Fi and wired Ethernet connections simultaneously, but also to users who want to connect some machines directly to the Internet using a cable modem or DSL connection. The program supports multiple user accounts so that it can act as a multi-user system. The program allows to create multiple Ethernet or Wi-Fi adapters on a single computer and acts as a virtual network adapter. Each Ethernet bridge has its own unique MAC address in the network and is independent of the others. So, one Ethernet bridge can be configured to automatically detect the other bridges in the network and populate its interface list with those MAC addresses. It can also be specified to ignore other bridges if they are not detected. The user can manage multiple Ethernet bridges, configure their properties such as IP address, subnet mask, default gateway, etc. In addition, the user can specify the Ethernet bridge to be used as a gateway for the network adapter that is connected to the modem or modem-router. The program supports different types of Ethernet cards and adapters. The user can enable or disable the link status checks for the Ethernet interface and monitor the link status with different feedback messages. The program can configure a USB Ethernet adapter, a static network adapter, or a USB Wi-Fi adapter to act as a bridge. The user can save the settings to the specified registry key. This allows the user to apply the settings without opening the program. Once the application is installed, it can act as a systerm service and execute at system startup.
