The beginning In December 1982, Autodesk released AutoCAD as a desktop application for MS-DOS. AutoCAD was initially intended for drafting, but quickly expanded into modeling, creating a variety of parts and assembly drawings, and an early version of design visualization. A dedicated, graphical toolset was introduced in 1983. In 1984, a light pen (later renamed a "tilt sensor") was added to the software. While AutoCAD began as a 2D drafting application, a version specifically designed for mechanical design (MDD) was developed in 1985. In 1986, 3D modeling and geometry were introduced, and a "slicing" (or "screching") feature was added to allow users to print out paper sheets of section drawings. In 1987, a spoked wheel was added to the mouse, allowing for zooming and rotating the drawing window. In 1988, a rigid body functionality was added, allowing parts to be attached to other parts. In 1989, layers were introduced to allow multiple objects to be viewed at the same time. In 1990, 3D wireframes and surfaces were added. In 1991, support was added for non-linear features, including lines, polylines, arcs, splines, circles, and ellipses. In 1992, AutoCAD for Windows was released for MS-DOS and Windows 3.0. This same year also saw the introduction of B-splines and the ability to label geometric features. A "fresh new look" was introduced with the release of AutoCAD 1992, and a new user interface was introduced in 1993. In 1994, support for sheet metal was added, and a "merge" command was introduced, allowing the user to combine multiple drawings into one. In 1995, an improved user interface was introduced. A Windows port was introduced in 1996. The following year saw the introduction of a "task bar" user interface (UI). In 1999, support for the [translated|Japanese] and Korean languages was added. In 2000, a "rubber" functionality was added to the mouse, allowing users to move the drawing window by pressing the middle button. In 2001, the "select" tool was changed to a "selection tool," a "dynamic tag" feature was added, and the "screwdriver" tool was added to allow users to quickly create and remove parts. Click here to

Category:AutoCAD Toxicity of 2,4,6-trinitrotoluene on survival and reproduction of zebrafish (Danio rerio) embryos and larvae. The toxic effect of 2,4,6-trinitrotoluene (TNT) was evaluated using zebrafish (Danio rerio) embryos and larvae.

Embryo, larval and adult fish were exposed to TNT for 5 d to determine lethal concentrations (LC(50)s) and 14 d to determine sublethal concentrations (LC(10)s). The 48 h LC(50) for embryos was 1.83 mg/L TNT, whereas LC(50) for larvae was 0.03 mg/L. The LC(50)s for TNT in adult fish were 4.29 mg/L for 24 h and 13.21 mg/L for 96 h. A significant increase in the ratio of dead larvae was observed with an increase in TNT concentration, and a significant reduction in the ratio of live larvae was observed with a decrease in TNT concentration. The LC(10) for the embryonic and larval stages was 0.02 mg/L, and the LC(10) for the adult stage was 0.45 mg/L. Based on the mortality ratio, the toxicity of TNT to fish embryos and larvae was less severe than for adult fish. In addition, a significant reduction in the survival ratio of embryos and larvae was observed with exposure to TNT concentrations of 0.05, 0.10, 0.25 and 0.50 mg/L. However, no apparent effects on the reproductive index or morphological abnormality were observed in embryos or larvae exposed to TNT. This study indicates that the fish embryo and larva are more sensitive to the toxicity of TNT than the adult. a1d647c40b

A survey of nurse managers and RNs was performed to identify levels of knowledge about administration of patient-controlled analgesia (PCA) and identify barriers to administering PCA. Approximately 75% of nurses surveyed believed nurses had the knowledge to administer PCA. The majority of nurses were confident they could obtain sufficient PCA equipment and education to administer PCA. However, 42% of nurses were uncertain if PCA was beneficial. Get your solar: Get ready for the GO GREEN DAY October 10, 2013 A national solar day is coming up. On October 21, electricity companies throughout the country will celebrate the 25th anniversary of a national day of solar celebration. The solar day was organized by SunPower, the leading solar-panel manufacturer. The idea was to raise awareness about the benefits of solar energy. That was nearly 25 years ago, but we haven't made much progress in the last 25 years. This is a good opportunity to pause and reflect on how far we have come and how we can get to a point where we need to be. Most Canadians live in areas that are sunny. And most people use electricity for a wide range of daily activities, from cooking, to powering an electric vehicle or running a computer. The idea of installing a solar system to offset a portion of your home's electricity usage makes sense. Today, the average home is using approximately 10,000 kilowatt hours of energy per year. If your home is consuming 1,000 kilowatt hours of energy each year, a solar system can reduce your electricity bill by 20 per cent. The cost of installing a system
