If you are looking for Outlook Express email address checker then you have come to the right place. KeyMail is an application that was originally developed to check email addresses for use in bulk e-mail systems. Now it's free & powerful enough that it can be used for any purpose. KeyMail allows you to look up email addresses in the

body of your email, in the contacts section, in the tasks section, in the notes section and even in the emails and folders section. In case you find an email address in any of these sections, you can add a contact with that email address, move it to a new folder, forward it to a certain address, print it, send a reply, save a copy in the drafts folder or send a copy to a specific address. It also provides a rules section, that allows you to configure rules for the email addresses that you find. The rules can be created via the GUI or via an XML file. You can add the rule after finding the email address in any of the sections, including the tasks, notes, folders, emails, export, contacts and headers. With the rule editor, you can create an “if then” function that is triggered by a specific rule. You can also create filters that will automate some of the tasks for you. You can

---

create filters that will automatically be sent to the target folder or that will delete the email if the email address found is invalid or an email was received from that email address. KeyMail can also be used to check for specific email addresses. You can use it to look up for any email address. You can also check if the email is in use and is valid. The filter editor allows you to create your own filters or read the ones that were created by other users. If you are looking for an email address checker, KeyMail is the tool for you. KeyMail also comes with an engine that can perform different tasks based on the type of the email address found. You can use the task editor to move email addresses found in different email, folders or contacts section to a different folder, remove email addresses found in the contacts section from the email, move email addresses from the

tasks section to a different task, send email to a specific address

Check your email addresses Atomic Mail Verifier lets you import the list with email addresses from TXT, CSV, XLS, XLSX, DOC, DOCX, ODS and ODT file format. Verifying email addresses can be done with the aid of three modes. You may check the syntax (email addresses are checked if they correspond to the standard email spelling rules), domains (the tool verifies if domains exist) or email addresses to see if the SMTP server corresponds to the current domain and user exists. You may pause or stop the current process, view information about each scanned email address (e.g. error messages such as server is temporarily unavailable, try to connect later and IP address has been rejected, status, log), as well as manually set the status for each item in the list (Correct,

Incorrect, Missed, Unchecked). Filter configuration settings Atomic Mail Verifier gives you the option to add a mask to a domain of an email address. Once you apply a filter, the selected item will always be marked as Valid, Invalid, Missed or Unchecked. General setup parameters You are given the freedom to enable the logging function, show the log, set up proxy, DNS and SMTP parameters, as well as create a list with user-defined server names and assign a status to each one in order to speed up the verification mode.
