The calculation of the scattered light from small particles requires the knowledge of the particle shape and their refractive indices. In this work we present a numerical algorithm for solving the problem of scattering from small particles. The algorithm is based on the method of moments, the boundary element method and standard numerical techniques. It solves the inverse problem of determining the particle shape from the scattered light measurements. The refractive indices of the particles can be also calculated in a straightforward way. Several examples of numerical calculations of scattered light are given. The effect of cancer on family caregiver well-being. Family caregivers are critical in the health care of cancer patients. When cancer is in remission, caregivers are faced with numerous challenges that affect their well-being. This study examined the effect of family caregiver burden on caregiver well-being. A total of 187 caregivers of cancer patients were interviewed, each assessing both the patient's and caregiver's well-being with the Medical Outcomes Study Short Form. Caregivers were of three categories based on their informal caregiving role: "caring for the patient during chemotherapy" (N = 65), "caring for the patient at other stages of illness" (N = 41), and "caring for the patient well after the patient is in remission" (N = 111). Results of a regression analysis demonstrated that the "caring for the patient at other stages of illness" caregivers were significantly more burdened than those in the other two groups. In addition, in an "end of life" comparison, the "caring for the patient well after the patient is in remission" group experienced significantly greater burden than the other two groups. Specifically, these caregivers experienced an average of two and one-half more days of caregiver burden during the month of the study than caregivers of patients during other stages of illness. The implications of the results on nursing interventions are discussed. man's vice." "You saw me doing it, and now you decide to return the favor." "How long were you filming me?" "No." "I wasn't filming you." "Ow." "They just look so innocent." "Would you be offended if I asked you not to tell her?" "Why?" "

5.1.0.18.Q: How to solve this  $A - \lambda I_n$  is invertible implies  $\lambda \in \mathbb{C} \setminus \{0, 1\}$ ? Let  $A \in \mathbb{C}^{n \times n}$  be such that  $A - \lambda I_n$  is invertible. How to prove  $\lambda \in \mathbb{C} \setminus \{0, 1\}$ ? I can prove the statement under the assumption that  $A \neq I_n$  by the fact that:  $A - \lambda I_n$  is invertible implies  $\text{det}(A - \lambda I_n) \neq 0$  we can show  $\text{det}(A - \lambda I_n) = \text{det}(A - I_n) - \lambda \text{det}(A - I_n)$   $\text{det}(A - I_n) \neq 0$  by the assumption.  $\text{det}(A - I_n) \neq 0$  means  $A$  is invertible. Can I assume  $\text{det}(A - I_n) \neq 0$  then the  $A - \lambda I_n$  is invertible implies  $\lambda \in \mathbb{C} \setminus \{0, 1\}$ . However, it seems invalid. A: It is true, because  $\lambda \in$

---

$\mathbb{C} \setminus \{0,1\}$  implies  $\det(A - \lambda I_n) \neq 0$ , as the determinant is a continuous function in  $\lambda$ . Q: Are neutrinos created and annihilated pairs?
