SqlMetal Builder allows you to specify connections, and configure properties in

your database. It also allows you to specify folders that will be used when exporting the code and database items, allowing you to configure the individual output paths in a single place. The output folders will be dependent upon the version of Visual Studio that you are using to edit the source code. A number of metadata properties will be automatically retrieved from the source code during the build process, including database version, compiler version, etc. Allowing build environments to be independent of each other allows you to ensure that each developer builds against a consistent set of settings for the output folders. Additionally, you can use the Build

menu to trigger the build of the project. This menu item is also visible at the top right of the window.
